NOIR – Premium Store

E-Commerce Website

Web Development Internship – Final Project Report

Project Name:	NOIR – Premium Store
Project Type:	E-Commerce Website (Frontend)
Technologies:	HTML5, CSS3, JavaScript
Tools Used:	VS Code, Git and GitHub
Deployment:	GitHub Pages
Intern Name:	Swathi A

Submitted in partial fulfillment of Web Development Internship Assignment

1. Project Title

NOIR – Premium Store (E-Commerce Website)

2. Project Objective

The main goal of this project was to build a working e-commerce website using only HTML, CSS, and JavaScript. I wanted to create a simple, good-looking store with a dark theme that works properly on mobile phones. I did not use any frontend libraries like React or Bootstrap.

3. Project Overview

NOIR is a frontend e-commerce website for lifestyle essentials like bags, apparel, and daily accessories. The website displays products dynamically with JavaScript, allows live search and category filtering, and includes a slide-out shopping cart where users can add items, change quantities, and see their order total. Cart data is saved in localStorage so it stays after refreshing the page.

4. Technologies Used

Technology	What I Used It For
HTML5	Page layout using semantic tags (header, main, section, nav, dialog, footer).
CSS3	Dark theme styling, CSS Grid for products, Flexbox, and media queries.
JavaScript	Dynamic product cards, search, category filters, cart logic, and localStorage.
VS Code, Git, GitHub	Code editing, version control, and project hosting on GitHub Pages.

5. Main Features

- Dynamic product cards generated from JavaScript objects
- Live search bar filtering items in real time
- Category filter buttons (All, Accessories, Apparel, Lifestyle)
- Sorting products by price or name
- Slide-out shopping bag drawer with quantity controls
- Order subtotal calculation and free shipping notification
- Cart persistence using browser localStorage
- Email newsletter form with validation
- Demo checkout popup form
- Mobile responsive layout for phones and tablets

6. Output Screenshots

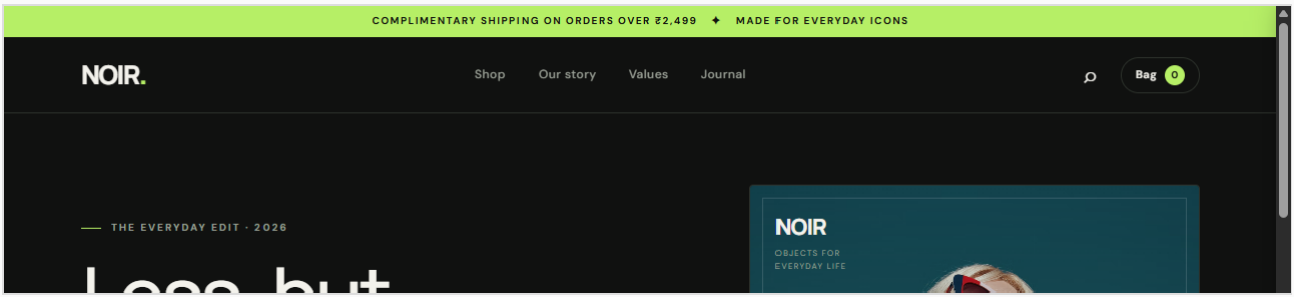

Figure 1: Desktop Homepage – Hero section with store banner, navigation bar, and clean dark modern styling.

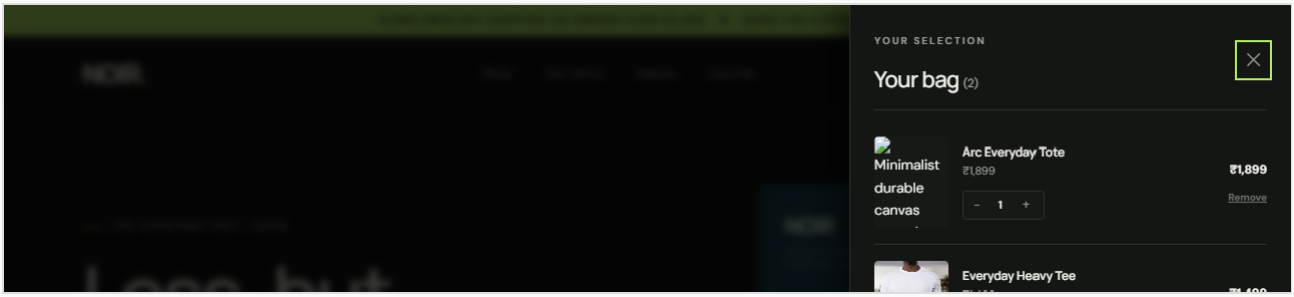

Figure 2: Shopping Cart Drawer – Slide-out bag showing added items, quantity adjustment buttons, subtotal, and free shipping note.

Figure 3: Mobile View – Responsive mobile phone view showing stacked single-column layout and mobile navigation.

9. Challenges Faced

The hardest challenge was keeping cart data synchronized. When an item was added, changed, or removed, the header badge, cart drawer, subtotal, and localStorage all needed to update together. Another challenge was responsiveness, where fixed heading sizes and multi-column grids caused horizontal overflow on narrow mobile screens.

10. Solutions Implemented

To solve the cart issue, I stored items in a single state array and created a renderCart() function that updates the cart UI and localStorage in one place. For responsiveness, I used CSS clamp() for fluid typography and set media queries to change the grid layout on smaller screens.

11. Key Learnings

I learned how to build a complete frontend website using pure JavaScript without depending on external libraries. I also learned how to use localStorage for data persistence, how to structure responsive layouts using CSS Grid and Flexbox, and how to use Git and GitHub Pages for publishing websites.

12. Future Improvements

- Connect a backend database for real product management
- Add an online payment gateway like Razorpay
- Create dedicated product detail pages with customer reviews
- Add user authentication and past order history
